| General Description The CD4066BM/CD4066BC is a quad bilateral switch in- tended for the transmission or multiplexing of analog or digi- tal signals. It is pin-for-pin compatible with CD4016BM/ CD4016BC, but has a much lower "ON" resistance, and "ON" resistance is relatively constant over the input-signal range. | eq:stremely low 'OFF'' 0.1 nA (typ.) switch leakage |
|---|--|
| $eq:spectral_$ | Applications Analog signal switching/multiplexing Signal gating Squelch control Chopper Modulator/Demodulator Commutating switch Digital signal switching/multiplexing CMOS logic implementation Analog-to-digital/digital-to-analog conversion Digital control of frequency, impedance, phase, and analog-signal-gain |

*AC Parameters are guaranteed by DC correlated testing.

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The tables of "Recommended Operating Conditions" and "Electrical Characteristics" provide conditions for actual device operation.

Note 2: V_{SS}=0V unless otherwise specified.

Note 3: These devices should not be connected to circuits with the power "ON".

Note 4: In all cases, there is approximately 5 pF of probe and jig capacitance in the output; however, this capacitance is included in C_L wherever it is specified. Note 5: V_{IS} is the voltage at the in/out pin and V_{OS} is the voltage at the out/in pin. V_C is the voltage at the control input.

Note 5. Vis the voltage at the involt pin and vis is the voltage at the out in pin. Vis the voltage at the control nipt

Note 6: Conditions for V_{IHC}: a) V_{IS}=V_{DD}, I_{OS}=standard B series I_{OH} b) V_{IS}=0V, I_{OL}=standard B series I_{OL}.

AC Test Circuits and Switching Time Waveforms

Special Considerations

In applications where separate power sources are used to drive V_{DD} and the signal input, the V_{DD} current capability should exceed $V_{DD}/R_{\rm L}$ ($R_{\rm L}$ = effective external load of the 4 CD4066BM/CD4066BC bilateral switches). This provision avoids any permanent current flow or clamp action of the V_{DD} supply when power is applied or removed from CD4066BM/CD4066BC.

In certain applications, the external load-resistor current may include both V_{DD} and signal-line components. To avoid

drawing V_{DD} current when switch current flows into terminals 1, 4, 8 or 11, the voltage drop across the bidirectional switch must not exceed 0.6V at $T_A{\leq}25^\circ\text{C}$, or 0.4V at $T_A{>}25^\circ\text{C}$ (calculated from R_{ON} values shown).

No V_{DD} current will flow through ${\rm R}_{\rm L}$ if the switch current flows into terminals 2, 3, 9 or 10.

National does not assume any responsibility for use of any circuitry described, no circuit patent licenses are implied and National reserves the right at any time without notice to change said circuitry and specifications.
